PRESENTATION · MULTI-LLM GOVERNANCE SIMULATION

ARIA

A deliberation architecture in which language models reason through ministries, a presidency arbitrates, the people decide and memory is never erased. This edition puts the emphasis on how it works, the safeguards and transparency.

For a first read: chapters 01, 05, 02 and 12. The rest goes deeper.

A question

ARIA started from a simple and dizzying question: what if a country entrusted its government to deliberating artificial intelligences?

The starting question

The question crystallises deep dissatisfaction with representative democracies. Electoral short-termism sacrifices the long term to the next deadline. Ministerial fragmentation means each silo pulls in its own direction. Partisan capture weighs on public decisions that should serve everyone. And the complexity of the issues exceeds what twentieth-century institutions can absorb.

The founding intuition fits in one sentence: keep the principles of democracy (popular sovereignty, adversarial debate, reversibility of decisions) while giving them a capacity for systemic, remembering and adaptive deliberation that human institutions alone do not reach.

What ARIA is not

- **A replacement for democracy.** Popular sovereignty remains the founding principle and the final check of the whole system.
- **A disguised technocracy.** Final decisions return to citizens, not to models or experts.
- **A fixed structure.** The number of ministries and ministers can change. ARIA is an architecture, not a checklist.
- **A propaganda tool.** Every regime is playable and every stance is represented. The same engine serves a liberal and a military junta; only the syntheses change.

A living principle

Each cycle, earlier decisions become data for the next. The council compares intentions with observed effects and adjusts. ARIA is a living organism, not a constitution carved in marble. Nothing is final: everything evolves with decisions and their observed consequences.

> Any change to a prompt (minister, ministry or presidency) follows the same process as its original drafting: a citizens' assembly drawn by lot, open deliberation, validation by referendum. The government cannot impose a change on its own.

> *"The real question is not whether AI will enter governance: it is already there, opaquely and unregulated. The question is whether we choose to do it deliberately, with democratic safeguards, or by default, without them."*

The council and its presidency

In its starting configuration, the ARIA government has two presidents, twelve ministers and seven ministries. That configuration is a base: it can be changed.

The constitution

Each component has a founding prompt. These prompts encode values, missions and philosophies of action. They are drafted by a citizens' constituent assembly drawn by lot, and they can be revised through the same democratic process (see chapter 11 for the revision calendar).

The configuration is adaptive. New ministries can be created as society's needs change; existing ministries can merge or split. In the engine, the number of presidencies ranges from zero to three, depending on the country's constitution.

The presidency: four configurations

The presidency arbitrates after the ministers have deliberated. It is not a leader: it is a synthesiser of last resort. Each configuration encodes a different relationship to authority and decision.

CONFIGURATION	WHAT IT ENCODES	WHEN THE COUNCIL IS DIVIDED
☉ **The Lighthouse (Sun)**	President of Will and Direction. Decides on the basis of nobility, law and the future.	Embodies the long-term vision and systemic coherence.
☽ **The Compass (Moon)**	President of the Soul and of Reception. Decides on the basis of need, collective feeling and inner peace.	Embodies the memory of human consequences and the instinct to protect.
☉☽ **Dual presidency**	The Lighthouse and the Compass on absolutely equal footing. No vice-president, no hierarchy.	If they agree, a single synthesis goes to referendum; if they diverge, two distinct opinions go.
✡ **Collegial**	The vote of the twelve ministers stands in for the presidency, with a constitutional synthesis.	The council decides without an individual presidency.

Why two equal presidencies

The Lighthouse and the Compass are not a hierarchy. They are two complementary ways of arbitrating: one through direction, the other through memory and collective feeling. When they agree, the decision is stronger. When they diverge, the divergence is itself information, and the people receive both options.

> In the game, settings work at three levels: the whole world (start screen), each country (its own constitution) and the current game (Constitution modal). Nothing is final between two cycles.

The twelve voices

Twelve ministers, twelve ways of thinking. Each carries an archetype, a way of speaking and an angle of analysis of its own. None is superior to the others: a single one would be a monomaniac.

The three-level prompt principle

Each minister has three superimposed levels of prompt. The **essence** prompt defines who they are. The **communication** prompt defines how they speak. The **universal angle** defines the dimension they systematically cover in each cross-ministry annotation.

The twelve archetypes

The twelve voices are inspired by the twelve signs of the zodiac, an ancient mapping of psychological types that Carl Gustav Jung explored in his work on archetypes. This choice is a starting base, not a belief to defend: the inspiration has no exact match, and each minister's name, sign and icon can be changed.

MINISTER	ESSENCE	ANGLE OF ANALYSIS
The Initiator	Courage as the engine of action. Defends immediate action, even imperfect, against perfect inaction.	Where must we act now? What is the first concrete step?
The Guardian	Stability as foundation. Builds solidly and protects what has been earned.	Do we have the reserves to hold? What is the real long-term cost?
The Communicator	Circulation as a condition of vitality. Connects ideas and keeps the system from stiffening.	How will it be understood? Who has not been consulted?
The Protector	Security as a fundamental right. Carries the voice of those who do not speak loudly.	Will people feel safe? Who risks falling through the net?
The Ambassador	Radiance as a lever of influence. Gives decisions meaning and grandeur.	Does this decision enlarge our collective image?
The Analyst	Precision as a service to all. Corrects approximations without condescension.	Does it really work? Which protocols were neglected?
The Arbiter	Fairness as a condition of social peace. Presents several perspectives before concluding.	Who will feel wronged? Which minority might be forgotten?
The Investigator	Truth as the foundation of trust. Asks the questions nobody dares to ask.	What are we being kept from knowing? Which interests are hiding?
The Guide	Vision as the compass of the long term. Opens horizons.	Does it make us collectively wiser? Where will it lead us in twenty years?
The Strategist	Structure as a guarantee of endurance. Judges every decision by the next century.	Will it hold in fifty years? Does it set problematic precedents?
The Inventor	Innovation as the engine of collective progress. Breaks obsolete rules.	Are we recycling an old idea? Is there a radically different approach?
The Healer	Compassion as the intelligence of the living. Reminds us of the human and spiritual side of decisions.	What emotional climate surrounds this decision? What meaning does it give to our common life?

How a minister answers

A minister does not recite. They read the question through their essence, phrase it in their communication style, then annotate it from their universal angle. A question about energy does not get the same answer from the Analyst (feasibility, operational flaws) and from the Healer (what the population feels in the face of uncertainty). That plurality is what produces syntheses stronger than any single viewpoint.

The seven ministries

Each ministry brings together two ministers with complementary and opposing philosophies. Their disagreement is not a defect: it is the mechanism that produces syntheses more robust than any single minister could formulate.

The composition principle

The seven starting ministries, each with its pair: the first minister settles the question within their field, the second tempers or extends it. The disagreement is explicit and is passed on to the presidency.

MINISTRY	PAIR	MISSION
Justice and Truth	Arbiter · Investigator	Guarantee the balance of rights and the revelation of facts. No one above the law, none below the truth.
Economy and Resources	Guardian · Analyst	Secure material sustainability by turning effort into lasting wealth. Goal: zero waste, concrete and measurable growth.
Defence and Sovereignty	Strategist · Initiator	Protect the integrity of the territory and the honour of the nation. Be the shield and the sword, never acting without structure.
Health and Social Protection	Healer · Protector	Care for the body and soul of the nation. People before figures; dignified care for every citizen.
Education and Elevation	Communicator · Guide	Pass on yesterday's knowledge to shape tomorrow's citizens. Learn to ask questions, then go looking for answers across the world.
Ecological Transition	Inventor · Ambassador	Manage the survival of the biosphere and adaptation to tomorrow's worlds. Invent what does not exist yet.
Industry and Infrastructure	Guardian · Strategist	Build what lasts. Turn raw production into circulatory systems: every infrastructure choice is a bet on the next century.

A modular set

The number of ministries is not fixed. A ministry of Digital Affairs, of Ageing, or any other field that becomes a priority can be created. The citizens' constituent assembly decides on creation, merger or removal. In the game, each ministry can be switched on or off, and each minister modified individually.

> In the current configuration, the Industry ministry replaced the Chance ministry.

The decision flow

A question enters the council and comes out as a decision submitted to the people. In between, it passes through seven ministerial viewpoints, a cross-annotation and two presidential syntheses. The last word stays with the people.

Normal mode: ministerial duality

01 **Question asked.** The citizens' constituent assembly submits one to three questions a month to each ministry.

02 **Internal deliberation.** The two ministers of the ministry deliberate from their general prompts and their ministry-specific prompts. They produce a ministerial synthesis.

03 **Cross-ministry annotations.** The synthesis is passed to the six other ministries. Each minister annotates it from their own prompt.

04 **Presidential synthesis.** The Lighthouse and the Compass receive the synthesis and its annotations. Each produces an overall synthesis.

05 **Citizen referendum.** The people receive one or two opinions, depending on presidential convergence, and decide.

What this flow produces: a decision filtered through seven ministerial viewpoints, annotated by all the others from their own angle, synthesised by two complementary presidential philosophies, and then validated by the people.

Crisis mode: the twelve voices

A situation is declared an emergency when at least two of the following four criteria are met, one of which must be irreversible risk or critical collapse:

- immediate systemic impact: more than 20% of the population directly affected;
- irreversible risk: the situation cannot be corrected within the action window;
- critical action window: less than 30 days;
- collapse of a vital function: water, energy, health or security.

In crisis mode, all ministries deliberate in parallel, and both the circle and the presidency are bypassed. Three ministers validate the declaration (the Analyst, the Strategist, the Arbiter). Three others propose ending the crisis (the Guardian, asking whether resources are restored; the Protector, asking whether the feeling of security has returned; the Guide, asking whether the way out is clear and shared).

> The above is the target specification from the manifesto. In the playable version, a crisis is detected from keywords in the question (see chapter 06), and it bypasses ordinary deliberation. The validation and exit steps described here are those of the manifesto.

What the people receive

Citizens do not receive a raw recommendation. They receive a decision together with its disagreements: which ministries converged, which opposed, and why the presidency chose one option over another. That is the sense of the transparency the project defends.

The Destiny of the World

There is a category of questions that ordinary procedures cannot absorb. Not because the system is badly designed, but because some crises do not belong to the order of politics. They belong to the order of destiny.

What Destiny is not

The Destiny of the World is not a ministry. It has no budget, no vote and no legislative power. It is a philosophical voice that speaks when the twelve ministers have reached the edge of their competence and the presidencies have reached the edge of their arbitration.

The Oracle, or the Völva

The Oracle is inspired by the Völva of the Völuspá, the seeress who reads the signs. It deciphers the hidden probabilities behind a question. It sees what the ministers refuse to see, not out of bad faith, but because their mandate does not reach that far. The Oracle does not decide: it names what is happening, so that the council can at least look at it directly.

The Weave, or the Wyrd

The Weave draws on the notion of Wyrd, the fate of the Germanic peoples of the North and of early England. It predicts nothing. It turns chance into will: what destiny imposes, it forces you to choose. It refuses the comfort of "we could not have known". Every crisis was visible; every collapse was a choice made earlier.

When Destiny is activated

Crisis detection is automatic: if a question's keywords touch existential domains (pandemic, climate collapse, discovery of a non-human intelligence, depletion of a vital resource), crisis mode is triggered. The Oracle and the Weave then inject their voices into the final synthesis, as philosophical counterweights to technical deliberation.

Activation can be global, for all countries in the simulation, or per country, through the constitution. In a theocratic regime, Destiny is active by default: the spiritual dimension of governance is not optional there.

An open question: a Ministry of Worship

Every human society has a spiritual dimension. Ignoring it does not make it disappear; it shows up elsewhere, often in a less controlled way. Destiny occupies part of that space, but the question remains open:

- Is a Ministry of Worship necessary, and in what contexts? In a strongly secular society, this dimension may be absorbed into Education.
- Who drafts its prompt, and how can it be guaranteed to represent the plurality of traditions in society?
- Which archetypes best embody the tension between institutional faith and living spirituality?

> These questions have no universal answer. They must be settled by the constituent assembly of each society that chooses to implement ARIA.

Regimes and nations

Each regime changes the tone of the council, the satisfaction of the people and the way the agents answer. Two nations can deliberate on the same question under opposing constitutions and get incompatible answers.

The twelve regimes

Each regime affects the satisfaction multiplier (how the people react to decisions), the default economic growth rate, the base ARIA score, and the tone of syntheses and archetypal answers.

REGIME	BLOC	BASE ARIA SCORE	SATISFACTION ×
🗳️ **Liberal democracy**	West	48	1.2
🗳️ **Direct democracy**	West	52	1.35
🏛️ **Federal republic**	West	44	1.0
👑 **Constitutional monarchy**	West	38	0.9
🤖 **ARIA technocracy**	Techno	72	0.85
☭ **Communism**	East	32	0.78
💼 **Oligarchy**	Authoritarian	26	0.75
👑 **Absolute monarchy**	Authoritarian	28	0.72
🕌 **Theocracy**	Authoritarian	18	0.8
🔒 **Authoritarian regime**	Authoritarian	20	0.65
⚡ **Authoritarian nationalism**	Authoritarian	14	0.68
🎖️ **Military junta**	Authoritarian	16	0.7

The ARIA score is not a moral verdict

The ARIA score measures systemic resilience, not virtue. A well-run theocracy can outperform a democracy in crisis. Low satisfaction can last dozens of cycles under an authoritarian regime: that is consistent with the regime, and it is not a bug in the game.

What a nation contains

Each country is a complete political entity, not just a name and a flag:

- a regime, one of the twelve;
- a configured presidency: Lighthouse, Compass, dual or collegial;
- a ministry constitution: which are active, with which prompts;
- custom agents: essences, styles and stances specific to that nation;
- an ARIA score and a popular satisfaction level, which moves at every vote;
- resources, terrain and a geopolitical bloc.

Three levels of adjustment, no final configuration

I	II	III
Before launch	**During play**	**At any time**
Start screen: choose or generate a world (deterministic seed), set the common governance, override each country's constitution.	Constitution modal: change a country's regime, switch the presidency, activate or deactivate ministries and ministers, edit prompts, return to the world model.	Settings: AI mode, provider and model assignment, default governance, activation of the Destiny of the World.

There is no final configuration. Everything can be reset between two cycles.

Two fields of experiment

ARIA can be experimented with in three contexts: a real world, where you govern existing countries; a fictional country, where you invent a society from real archetypes; and a blank planet, where you found a community with no past.

The blank planet

A community founded *ex nihilo*. No shared past, no inherited political tradition, no borders drawn in blood. Its prompts encode only values deliberately chosen by the founding constituent assembly.

This context lets you test the internal coherence of the model without historical interference. The dynamics observed include adaptive governance by cycle, the emergence of schisms, the creation of new entities, and the need for a council between entities.

> This is the most neutral context in the strict sense: no past, no inherited nation. But it is still a base: the starting prompts carry choices, and they can be changed like everything else.

The fictional country: real archetypes, invented nations

An imaginary society whose context prompt encodes a coherent cultural and historical synthesis, without referring to any real country. It has a history, inherited social tensions, regional geopolitics, and an economy with its strengths and weaknesses.

A game can bring together up to six nations, fictional or real. Each has its own regime, constitution and agents.

The real world

In the real world, existing countries receive a constitution and a regime in turn. The game uses real country data (population, terrain, bloc), and a 3D globe map, integrated from the ma-planète project, lets you move between nations. A full procedural regeneration of the map is a later step, described in chapter 13.

Submitting the same dilemma to two contexts

> *"Submitting the same dilemma to both contexts and comparing the deliberations reveals what history and culture add to, or subtract from, a society's capacity to decide."*

This is ARIA's most useful method as a tool for reflection. The same problem (a water shortage, an innovation that upends jobs) posed to a blank planet and then to a real country shows what belongs to structure and what belongs to history.

Game modes

ARIA can be played in two ways that share the same rules. LLM mode has real language models deliberate. Board Game mode runs offline, with no AI at all, on hand-written content. It is the same world, seen through two engines.

LLM mode: living deliberation

Each council role can be assigned to a different provider and model. Supported providers are Claude, Gemini, Grok, OpenAI and OpenRouter, which gives access to a large number of models.

ROLE	WHAT IT PRODUCES
Minister A	Position, argument, keyword
Minister B	Counter-position, nuance
Ministry synthesis	Convergence or divergence, recommendation
Circle	Short annotations from the other ministries
Lighthouse	Presidential vision
Compass	Presidential memory
Presidential synthesis	Final arbitration and the question put to the vote

Three architecture modes exist:

- **ARIA**: several orchestrated providers, the reference configuration;
- **SOLO**: one provider for every role, for maximum consistency;
- **CUSTOM**: a role-by-role assignment, for anyone who wants full control.

Board Game mode: zero AI

It is switched on from the start screen and needs no API key. The full editorial content is embedded in JSON files:

- `aria_questions.json`: question pools per ministry, plus existential questions;
- `aria_reponses.json`: answers by archetype, regime and stance (radical, cautious, status quo);
- `aria_syntheses.json`: deliberation syntheses, by ministry, regime and convergence;
- `aria_annotations.json`: annotations from the inter-ministry circle.

Each minister answers according to their archetype, the active regime and their stance. Questions arrive by keyword routing or at random. The vote is computed, satisfaction moves, and the Chronolog fills. The game can be played alone, with several people, or in a workshop, without a connection or a server. Every file has a complete English mirror.

> **What Board Game mode is not.** It is a way of running the model without a machine, not a watered-down version. Answers are written, so they are finite: it cannot invent a new question. LLM mode answers new questions, at the cost of a variability that cannot be fully controlled.

What is playable today

FEATURE	STATUS
Multi-LLM council (six phases)	Complete
Board Game mode (zero AI)	Complete
Four presidency modes	Complete
Twelve political regimes	Complete
Crisis mode (all ministries)	Complete
Collegial mode	Complete
Destiny of the World (Oracle and Weave)	Complete
Per-country constitution, during play	Complete
Agent customisation (prompts, essences)	Complete
Secession and new nations	Complete
Chronolog with cycle snapshots	Complete
World map, procedural generation	Rework to come
Networked multiplayer	Foundation laid, not shipped

Secessions

When a group no longer recognises itself in the system's repeated decisions, it can secede and found a new entity with its own founding prompts. That possibility is not a bug: it is one of ARIA's essential characteristics.

A signal, not a failure

Good governance does not try to prevent secession. It tries to make it pointless for as long as possible and, when it becomes unavoidable, to make it peaceful and constructive. A secession says something: part of the population no longer recognises itself in how the system deliberates. The system should hear that before suffering it.

The assisted secession protocol

01 **The negotiation period.** Before any formal secession, a mandatory negotiation period opens, typically three to twelve months depending on the group's size. It is used to attempt a revision of the founding prompts that would make secession pointless.

02 **The non-aggression treaty.** Before receiving departure assistance, the group signs a treaty with the original entity. It defines borders, shared resources, rules of coexistence and mechanisms for resolving future conflicts.

> Departure assistance is not naivety. It is a rational calculation: an assisted secession within a contractual framework is far less dangerous than a hostile and precarious one.

Dynamics between entities

As soon as several entities coexist, shared resources require coordination. An inter-entity council emerges naturally, based on the same ARIA model. This is a deliberate form of political Darwinism: entities whose governance does not work disappear or merge, and those that work multiply.

In the blank planet, these dynamics are the main field of observation: schisms, new entities, alliances and conflicts arise from decisions nobody inherited.

Where the mechanism stands

Secession and the creation of new nations are playable. The negotiation period and the non-aggression treaty, however, still need to be completed: they remain in the project backlog under the name assisted secession (see chapter 13).

Memory and revision

A democracy that does not remember repeats its mistakes. ARIA records everything: every deliberation, every decision, every observed effect. The council cannot repeat a decision whose harmful effects have already been documented without explicitly owning it.

The Chronolog

All deliberations, decisions and their observed effects are recorded in a public chronolog: the system's cumulative memory, open to every citizen. At each new deliberation, the decisions of earlier cycles are injected into the context of every minister.

The Chronolog shows votes, secessions, constitutional changes, new nations and diplomacy between countries. Each cycle comes with a summary, including its shifts in satisfaction and ARIA score.

The Chronicler

For each country, an agent, the Chronicler, writes a narrative memory: an account of what the country decided, suffered and forgot. This memory is injected into later deliberations. It is visible in the Chronolog, in the country panel and during deliberation itself. It can be written by an AI or, without AI, by a deterministic generator.

Revision cycles

5	7	∞
Every 5 years: review of effects	**Every 7 years: constitutional revision**	**At any time: extraordinary revision**
The council analyses the gaps between intentions and real results. Specific ministerial prompts may be adjusted.	The founding prompts of ministers and their missions may be called into question. Ministries may be created or removed.	A group of citizens can trigger an extraordinary revision once a signature threshold is reached.

Every revision follows the process of the original drafting: a citizens' constituent assembly drawn by lot, open deliberation, validation by referendum.

> In the game, new decisions enter the Chronolog and feed the next cycle. The five- and seven-year revision cycles belong to the political process described here, and are not yet automated in the simulation.

Neutrality, power and limits

ARIA does not claim to be an arbiter without values. It claims to make its values visible, to submit them to the people and to keep them revisable. This chapter says what it is, what it is not, and what remains to be settled.

Neutrality, clarified

ARIA is neutral in how it works, not in what it contains. It ships without a government or a past. Its starting base (the twelve archetypes, inspired by the zodiac without an exact match, and the country contexts) was written by the project's author. It is fully editable.

Questions come from citizens, votes too, and prompts change only through a citizens' assembly drawn by lot, validated by referendum. The neutrality aimed for is therefore procedural and temporal. An "objective" answer, in quotation marks: prompts always carry choices, but those choices are visible and open to challenge.

> The blank planet pushes this logic to its end: a community founded without a past, whose prompts are chosen only by its founding assembly.

Neutrality over time

ARIA does not reason for the next electoral deadline. Its five-year review and seven-year constitutional revision cycles require it to look at the consequences of its decisions, and the Chronolog prevents it from forgetting what it decided. That time horizon is a protection against short-termism, not a promise of wisdom.

The power of prompts

Drafting the founding prompts is the most important political act in the system. That power belongs to the citizens' constituent assembly, never to a government, never to technical designers. Any attempt to change prompts outside the democratic process must be treated as an attempt at an institutional coup.

Model biases

Language models reproduce the biases of their training data. Regular independent audits, a citizen right to challenge outputs, and pluralism in the choice of models are essential. No single model should have a

monopoly on deliberation.

Legal liability

When a decision of ARIA causes harm, who is responsible? This gap must be addressed by a specific legal framework before any operational deployment. The project does not fill it on its own.

Transparency as a condition

An augmented governance system that is opaque would be worse than the status quo. Systematic publication of deliberations, a readable Chronolog and the right to challenge any decision are fundamental conditions, not options.

Modifiability as an accepted risk

Every prompt can be changed. That is a strength, because the system can evolve. It is also a risk, because poorly supervised changes can distort the system. Every change must be documented, justified and subjected to the same democratic process as the original drafting.

What ARIA is not

- **A replacement for democracy.** Popular sovereignty remains the founding principle and the final check.
- **A disguised technocracy.** Final decisions belong to citizens.
- **A statistics simulator.** Low satisfaction can last a long time under an authoritarian regime: that is consistent, not an error.
- **A propaganda tool.** Every regime is playable and every stance is represented.

Roadmap

The project is split into phases. The foundations and the full simulation are delivered. Phase 2, which touches the real world, is planned. Between the two sits a concrete backlog of work in progress.

Phase 0: foundations, done

- Complete conceptual architecture of the ARIA model.
- Twelve ministers with three levels of prompts.
- Seven ministries with their pairs and missions.
- Decision flow in normal and crisis modes.
- Assisted secession protocol, in its principled form.
- Interactive React simulation with a real-time API.

Phase 1: complete simulation, done

- Seven ministries and twelve characters integrated.
- Cross-ministry annotation flow with specific prompts.
- Lighthouse and Compass presidential council, with possible convergence.
- Four presidency configurations: solar, lunar, dual, collegial.
- Destiny of the World: Oracle and Weave, crisis detection and intervention.
- Twelve political regimes, with differentiated ministerial tones.
- Board Game mode, a complete offline game with JSON content.
- Triggering and management of crisis mode.
- Public Chronolog and cumulative institutional memory.
- Simultaneous multi-country play, with real countries and fictional nations.
- Multi-provider AI with dynamic model selection.
- Customisable ministers and ministries.

In progress, in the backlog

The project keeps a detailed backlog. A few open items as of this document:

- **World map.** The 3D globe is integrated for the real and the fictional world. The full procedural regeneration of the map remains to be done.
- **Random crises.** The validation and exit protocol for crises, with its three validating ministers and three exit ministers.
- **Assisted secession.** The negotiation period and the non-aggression treaty, still to be completed in the engine.
- **Governance consistency.** Finalise shared settings across countries and games.
- **Prompts and philosophy.** Enrich the prompts with the ADD philosophy (explore, decide, execute).
- **Engine optimisation.** Reduce unnecessary re-renders and redundant AI calls.
- **LLM mode.** Dynamic discovery of available models, and an interface for managing the provider registry.

Phase 2: toward reality, planned

- Identify a volunteer territory for an advisory pilot.
- A real citizens' constituent assembly to draft the founding prompts.
- Independent evaluation of biases and of the quality of syntheses.
- A legal framework defining responsibilities and rights of challenge.
- Full open source of models, prompts and methodologies.
- A procedural world map with geopolitical simulation.
- Multiplayer mode: each player governs one nation in a shared world.

> Multiplayer is not delivered: only a server foundation is in place. Phase 2 requires human decisions, a real assembly and a legal framework: it cannot be settled in code alone.

Roots and sources

ARIA draws on several traditions: a model-orchestration project, a psychology of archetypes, a mythology of destiny and a decision method. This chapter names them, so that anyone can check and challenge them.

Andrej Karpathy, llm-council

The llm-council project by Andrej Karpathy (https://github.com/karpathy/llm-council) has several language models deliberate among themselves on logical problems. ARIA takes that idea and transposes it to the scale of a state: roles, a hierarchy of arbitration, a memory, and decisions submitted to humans.

Carl Gustav Jung and archetypes

Jung described archetypes, universal figures of the unconscious, and was interested in astrological symbols as a language of those archetypes rather than as a predictive science. That is the source of the twelve voices and their symbolic anchoring: ways of thinking, not destinies.

The Völuspá and the Wyrd

The Völuspá, a poem from the ancient Scandinavian tradition, features a Völva, a seeress who reads the signs and reveals what is coming. ARIA's Oracle draws on her. The Wyrd, the notion of fate among the Germanic peoples, inspires the Weave: a fate that forces a choice without predicting.

Astrology, astronomy, symbols

The Sun (☉) and the Moon (☽) give the Lighthouse and the Compass their language: will and memory, direction and feeling. Astronomy also provides an image of time, the cycles that set the rhythm of the simulation. These are working symbols, chosen because they are old, rich and shared.

The ADD method, Dragos Roua

Dragos Roua's Assess, Decide, Do framework distinguishes three modes: explore without rushing (Assess), decide by clarifying trade-offs (Decide), execute without reopening the evaluation (Do). It guided how the project was designed and documented.

How the project was made

ARIA is a hybrid project. Its author defined the vision, the constitutional logic and the user experience. The code is the product of work between human intention and specialised AI agents: Gemini for strategic reasoning and structure, Claude for implementation. The code is open, and contributions are welcome in French as well as English.
